

I support RM-10765 and encourage the FCC to approve this docket.

I believe this to be a valuable and much needed public service.

Tests having taken place over the last several years
prove that this technology is viable for news and information
delivery.

Many in the communications community are aware of the weak spots in
our current information dissemination system. This tried and true method of
communications will serve as a back-up form of
broadcasting for emergency information during circumstances which
cripple current standard communications methods.

On a day-to-day basis, the RTTY Widecast system could be utilized
to provide news and information to the visually impaired with the simple
addition of a braille printer. This would keep the system "exercised" and
prepared to serve in a Homeland Security event. A win-win situation for all.

I urge you to support the approval of RM-10765 for the benefit of all of us.

Thank you for your time and consideration,

Sherry L. Hydrick
